Branch and Bound - UMN Statistics

Branch and Bound Recursive Procedure Input data: a set M of models and a bound $l = F(m)$ for some model m not necessarily in M Before any models have been evaluated set $l = +\infty$ Each time a model m is evaluated, if $F(m) < l$, then set $l = F(m)$ This procedure is designed to be called many

The G/M/1, G/G/1, G/G/m and M/G/m/m Queues

For (r/m) μ_1 in a G/G/m queue, a heavy traffic approximation result holds in a manner similar to that given for the G/G/1 case Specifically, for (r/m) μ_1 in a G/G/m queue, the waiting time in queue at steady-state tends towards a random variable with an exponential distribution which has a mean given by $W \approx \frac{m}{\mu_1} \left(\frac{1}{1 - \rho} \right)$

Bounding sums of the Möbius function over arithmetic ...

Let $M(x) = \sum_{n \leq x} \mu(n)$ where μ is the Möbius function. It is well-known that the Riemann Hypothesis is equivalent to the assertion that $M(x) = O(x^{1/2+\epsilon})$ for all $\epsilon > 0$. There has been much interest and progress in further bounding $M(x)$ under the assumption of the Riemann Hypothesis. In 2009, Soundararajan established the current best bound of $M(x)$.
